Full Stack Development — Mini E-Commerce Project

Lab Sheet 1: Building the Storefront (HTML + CSS) — Solution

Covers Project Phase 1 & Phase 2

Name	Akshit Negi
Course	B.Tech CSE — 5th Semester
CU ID	CU24250214
Repository	https://github.com/cu24250214-dotcom/Full_stack_BTCS303P

Objective	Build the static page structure of your e-commerce store, then style it into a responsive storefront.
Duration	2 hours
Prerequisite	Group formed, product category registered
Submission	index.html, product.html, cart.html, checkout.html + style.css

Part A — HTML Structure (Phase 1)

1. Create a project folder named <yourstore>-frontend. Inside it, create the following pages: index.html (Home), products.html (Product Listing), product-detail.html, cart.html, checkout.html.
2. On every page, add a common <header> with your store name/logo and a <nav> containing links to Home, Products, and Cart.
3. On index.html: add a hero/banner section introducing your store, and a 'Featured Products' section with at least 4 placeholder product blocks (image, name, price — plain HTML for now, no real data fetching yet).
4. On products.html: list at least 8 products using repeated HTML blocks (image, name, price, 'Add to Cart' button).
5. On product-detail.html: show one product's full details — larger image, name, description, price, quantity selector, 'Add to Cart' button.
6. On cart.html: create a table or list layout showing item name, quantity, price, subtotal, and a grand total row.
7. On checkout.html: create a <form> with fields for Name, Address, City, Pincode, Phone, and Payment Method (radio buttons), plus a 'Place Order' button.
8. Add a common <footer> with contact info and copyright text on every page.

Checkpoint: All pages should open correctly in the browser and link to each other via the navbar, even though there is no styling yet.

Part B — CSS Styling (Phase 2)

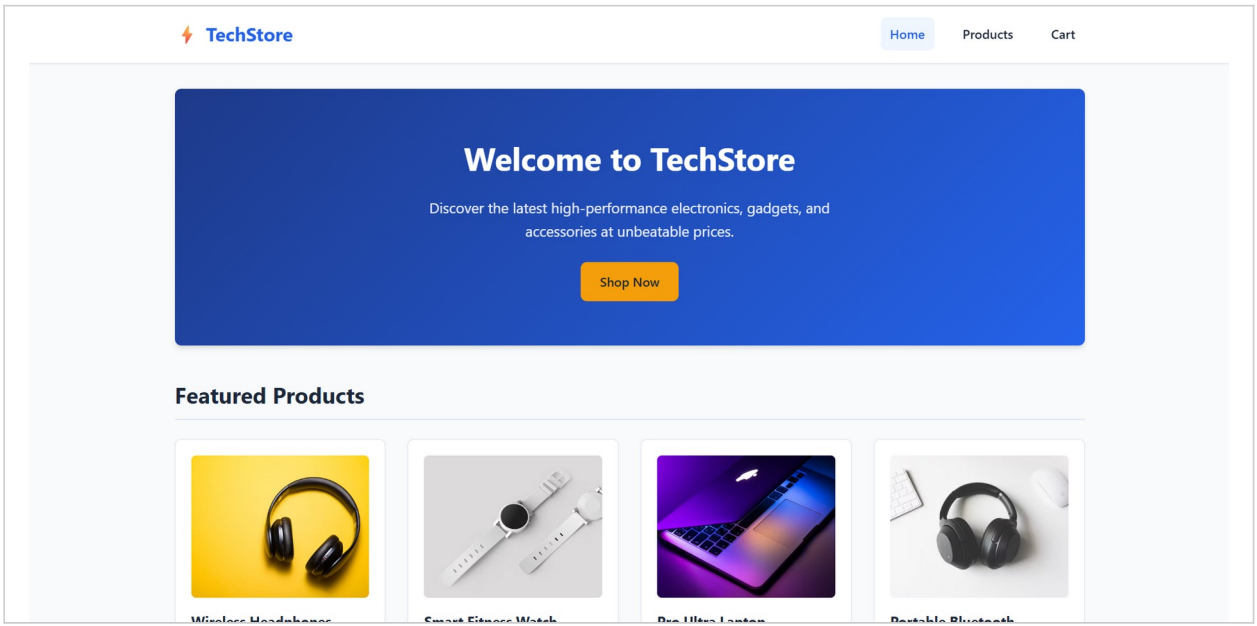

9. Create style.css and link it to all 5 pages.
10. Define 3-4 CSS custom properties (variables) for your color theme, e.g. :root { --primary-color: ...; --accent-color: ...; }.
11. Style the navbar using Flexbox (display: flex) so links are aligned horizontally with even spacing, and it collapses sensibly on smaller widths.
12. Style product blocks as 'cards': use padding, border or box-shadow, and border-radius (Box Model concepts).

13. Arrange the product listing grid using Flexbox or CSS Grid so cards wrap responsively across the row.
14. Style the checkout form: consistent input sizing, padding, focus states, and a clearly styled submit button with a hover effect.
15. Add at least one @media query so the layout adapts reasonably on a mobile-width screen (e.g., nav stacks vertically, cards go single-column).
16. Style the cart table/list and footer to match the overall theme.

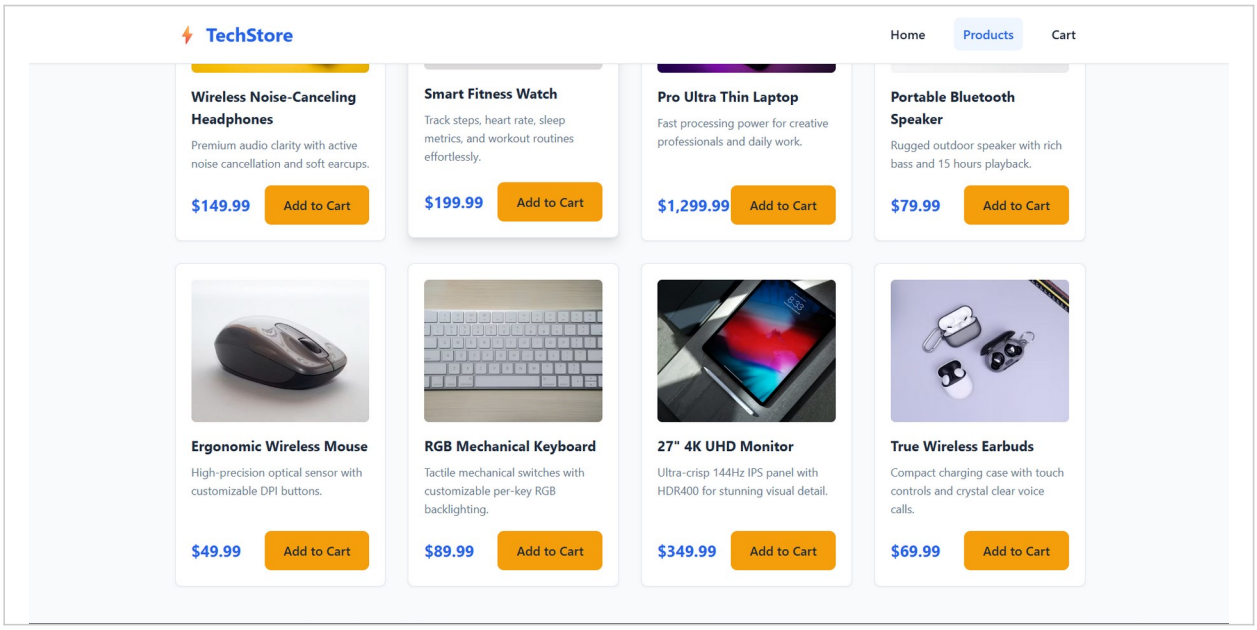

Solution — Output Screenshots

The following screenshots demonstrate the completed storefront, showing the implemented HTML structure and CSS styling described above.

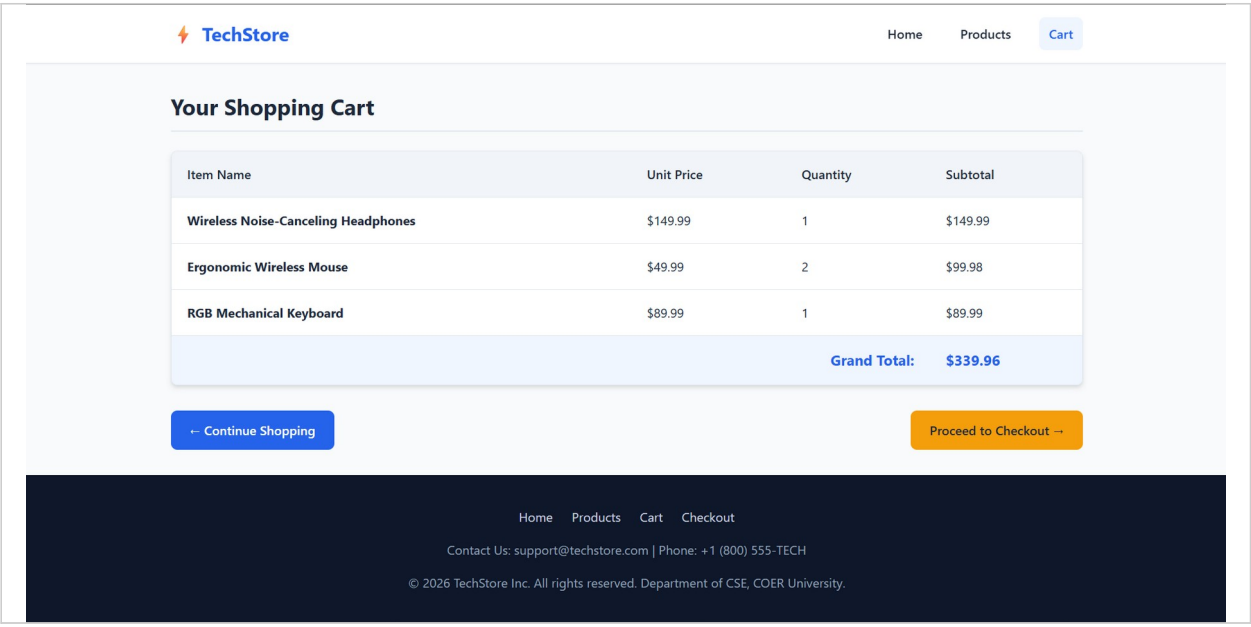

1. Home Page — Hero Banner & Featured Products

2. Products Page — Full Product Listing Grid (Flexbox/Grid cards)

3. Cart Page — Item Table with Subtotal & Grand Total

4. Checkout Page — Shipping & Payment Form
